Well Flow Rates

A flow rate and recovery test was taken. The test rate used was at a flow rate of 5 gpm for a period of 60 minutes. The total gallon count was 300 gallons. The well did not pump out and is adequate to supply the home.

Pump System Evaluation

At the time of our inspection, all components of the well pump system were in good working order. Our tests included but were not limited to inspecting pump head pressure, adequate motor run time evaluation, drawdown test, and overall performance of the system.

Bacteria and other water tests

A bacteria test was taken at the tap. The sampling point was sterilized and the sample was collected in an EPA provided sterile bottle. EPA sampling procedures were followed to obtain the sample. The test results showed the water to be negative for coliform and negative for E. coli bacteria. The bacteria passed.

Other lab tests

Summary

According to our observation, the system is in good working order.

Note: The purpose of this test is to report the present "as is" and visible condition of the system and it's related components. Water quantity and quality can change at any time; therefore, no warranty shall be expressed or implied for any part of the water system or water source evaluated.

SEPTIC SYSTEM DYE TEST REPORT

ORDERED BY: McInturf Realty CONTACT: Donna REF #:

DYE TEST PERFORMED BY: Dale London / Everclear Water Specialists

HOMEOWNERS NAME

Obermiller
4930 Second St
Sommerdale, OH

INSPECTION LOCATION

DATE: 9-1-10

Our company conducted a dye test and septic performance observation. Water was run to the septic at a flow rate of 5 gallons per minute for a period of 60 minutes. The total gallons pushed through the system were 300 gallons. The ground surface was observed before, during, and after the test. There was no change in ground moisture and no dye surfacing. There was no slow drainage or effluent back-up. The septic was not located and excavated. The location and condition of the underground tank and leaching field is unknown.

According to our observation, the system passed a minimal performance dye test or push test.

Most septic manufacturers recommend having septic tanks pumped every 1 to 3 years depending on usage as part of routine maintenance. The addition of Rid-X or equivalent bacteria into the system annually will increase the life of the system.

Note: Our goal is to provide our clients with a cost effective protocol which exercises system capabilities with sufficient rigor to provide reasonable assurance that inadequately treated effluent is not surfacing.

A dye test is a relatively low cost non-invasive method for testing of private sewage systems. This is a limited performance based test. This test does not provide a guarantee of the present or future performance of the system. A dye test is not a full evaluation of a sewage treatment system; however, it provides valuable information regarding the present performance of the system. A septic dye test is ideally suited for evaluation of septic systems for real estate sales purposes since the test does not result in damage to the property and it provides minimal disruption of the occupant's use of the home during the test. More comprehensive testing and evaluations are possible and may be desirable if greater assurance is needed.

Limitations of a dye test. A dye test cannot identify all types of wastewater treatment system failures. By itself a dye test is not indicative of the overall condition of the system. Snow, ice, vegetation, and leaf cover can hide surfacing effluent. Because the components of the system are buried, no guarantee can be made regarding the location or condition of private sewage treatment system components unless specific additional tests such as opening the septic tank, pumping the septic tank and excavation are ordered. These tests are not part of the sewage treatment system dye test that we perform.
